

In the Comfort of Your Home

You've heard the saying countless times. But just how comfortable is your home? Does it have to cost a fortune to heat and cool to your personal preference? Not anymore. Automated Ceiling Registers (ACR) ties ultimate comfort and energy savings together in one affordable solution.

MicroFlow2000™ - Zoning Made Simple

A new ceiling register design replaces antiquated metal registers that collect dust, rust, rattle, and whistle when closed. Our patented approach works by allowing users to determine how much conditioned air is introduced into each room of their home, redirecting airflow as needed and reducing or eliminating airflow in rooms not being used. Conditioned air is only provided where and when it is needed. The aerodynamic shape eliminates the chilling effect associated with conventional louvered registers, particularly when heat pump systems are used.

ACR offers a manual register designed to directly replace existing conventional metal registers. Simply remove the existing register and replace with the ACR manual register using the same screw mounting holes. To control airflow in the manual units, rotate the round structure of the vent to the position that produces the desired airflow.

The automated system is normally controlled using a single wall switch with users receiving direct feedback by watching the nearest ceiling register open or close. It can also be controlled from thermostats, timers, and wireless remote controls, including X10*.
