

"I like the idea that I am contributing to the goodness of the planet, not taking it away."

-Home Building Consultant

"The circular shape means the cool air is being diffused 360 degrees, not in a single blast that chills one occupant of the room while another is too warm."

-Home Builder

"I am able to get temperature balance from room to room, avoiding those annoying hot and cold spots which equates to a comfortable environment from season to season."

-Homeowner

Homeowners

Be comfortable.

Too many people find themselves uncomfortable in their own homes for many reasons. For example, the house is not being cooled or heated evenly, heat loads change throughout the day and with the season, metal louvered registers create uncomfortable drafts, and metal registers leak and create noise when closed. Controlled airflow can balance the air temperature from room to room in a single house

Current Home Owners

Remodel for comfort.

You do not have to invest in expensive zoning systems or additional units for your home to get the same results a new homebuyer can get with our system. Our registers can be self-installed to replace current metal registers - one size fits all.

New Home Buyer

Don't build without it.

The ACR system provides an alternative way to reduce homeowners' energy bills by an average of 25% or more, while also providing increased comfort level to the occupants for all seasons and occasions.

Electric Power Companies

Reduce your peak demand.

With ACR innovation, HVAC system energy reductions of 50% or more can be achieved during peak demand hours; and the system allows builders to reduce the size or the number of HVAC systems they install in new homes. Selectively controlling airflow is an attractive alternative to programmed disconnects of HVAC systems.

Consumers

Be in charge of your comfort.

Remember sliding glass doors, long shag carpets and roof-mounted TV antennas? Your ceiling registers are from the same era. The metal register has been around for over 60 years without any real improvements or innovations until now.

Studies have shown that during peak periods, a homeowner can realize 50% or more savings on their energy bills using the ACR MicroFlow2000™ system. A new modern look along with cleanliness and control, improves your personal comfort.

HVAC Contractors

Standardize and Save.

Savvy HVAC contractors provide energy efficient heating and cooling systems. Their margins are typically higher when zoning systems are used. Combining conventional HVAC hardware with ACR's system gives the customer a cost effective zoning system that means lower costs for the homeowner while providing owner comfort, a new modern look, energy efficiency, cleanliness, and a fresh air venting option - all available with the MicroFlow2000™ system.
